Part 3

Part 3, you will hear two university students, Louis and Claire, discussing their presentation on wave energy. First you have some time to look at questions 21 to 25.

Now listen carefully and answer questions 21 to 25.

Claire: Hi, Louis! I think that went alright, considering it was our first try. The tutor seemed engaged, at least.

Louis: Yeah, not bad. Though I wish we'd structured the beginning differently. But hey, at least we chose something genuinely interesting, right? Wave energy is just... different.

Claire: Absolutely! That was the whole point for me, honestly.

Louis: Exactly! That's precisely why I suggested wave energy initially. It popped up in a news feed about renewable alternatives, (21) there's a lot of information online about solar energy, but wave energy remains poorly understood by comparison.

Claire: Yeah, me too! It felt like a challenge, digging into something less obvious.

Louis: So, Claire, why isn't it more widely used yet? I mean, why hasn't wave energy been developed more extensively?

Claire: That's a great question. From what I've read, it's not really about government restrictions—there are actually test sites in multiple countries, like Scotland and Portugal.

Louis: Right. And there are many experts in this field. So, it's not a shortage of specialists holding it back.

Claire: Exactly. (22) The real problem seems to be funding. Private companies aren't investing enough to develop the technology to a commercially viable scale.

Louis: Yeah, that makes sense. You know, Claire, while researching wave energy, I came across something really surprising. It wasn't just technical or financial challenges.

Claire: Like what?

Louis: Well, you might face disputes with fishermen overfishing rights, or environmental groups worried about marine life. (23) Honestly, I hadn't considered the regulatory hurdles before. There could even be conflicts with shipping lanes.

Claire: Yes, that's definitely an issue. I think we can keep improving though – wave energy really has great potential! Of course, like all renewables, it's environmentally friendly long-term, (24) but its key advantage is predictability. You can forecast wave patterns days in advance with pretty good accuracy, unlike solar or wind, which depend on weather conditions. The sun sets, the wind stops blowing, but waves? They just keep rolling in consistently, driven by wind and tides far out at sea.

Louis: That's true! The ocean never stops moving, even when the sun isn't shining. Okay, moving on for our next presentation, should we start with the history of wave energy? or **how it generates electricity?**

Claire: Well, I think we should explain the fundamental mechanics first – (25) let's explain how it harvests energy from waves. Then introduce different designs and examples. I found that case study about the bio-mimicry device fascinating.

Louis: Agreed. We can build the foundation first.

Before you hear the rest of the talk, you have some time to look at questions 26 to 30.

Now listen and answer questions 26 to 30.

Claire: Louis, I've been reviewing those case studies we found. Remember the **Oyster device** in Scotland? What stood out was its **resilience during storms.**

Louis: Right! Because its core components were **fully submerged**, (26) the system kept operating even in terrible weather. Unlike surface floats, being **below the surface** meant waves crashing above didn't damage it.

Claire: Yeah, then speaking of anchors, the **WaveRoller's** setup was clever. (27) Its entire generator unit sat fixed at the seabed. That's why its **anchor system** was so critical—it had to withstand years of ocean forces.

Louis: Yes!

Claire: And that **bio - Wave** project in Australia — the one mimicking seaweed!

Louis: (28) Yeah! Its design was literally imitating nature — the engineers copied how kelp sways to create flexible arms that move with currents. So elegant!

Claire: Then there's the sad case of **Pelamis**, the snake-like device.

Louis: Yes, I know. A support ship incidentally rammed it during maintenance, causing irreversible damage. (29) That single accident was enough to shut down the entire operation.

Claire: And don't forget **CETO**. It was tested in Europe, and trials showed it worked. But scaling up?

Louis: Exactly. The **barrier to implementation** wasn't technology—it was money. When they calculated large-scale costs, (30) the projections were deemed financially unviable for investors.

Claire: Yes, for next steps, maybe we could compile these findings into a proper report and consult our tutor for feedback..

That's the end of Part 3. You now have half a minute to check your answers to Part 3.

2025 年 6 月 14 日大陆雅思纸笔考试听力文本

Part 3

You will hear two university students, Jack and Mia, talking about a research project they did together on the sense of smell. First, you have some time to look at Questions 21 to 26.

Now listen carefully and answer questions 21 to 26.

Jack: Hi, Mia! Finally handed in that smell research report. Feels good, doesn't it?

Mia: Tell me about it, Jack! What a journey. Remember how we nearly went down that impossible route at the start?

Jack: Oh yeah! (21) We firstly planned to study how age affects the sense of smell. Like, do older people smell things differently?

Mia: Exactly! But then reality hit. We realised it would be a nightmare, you know, people in different age groups have varying fitness levels, which made it way too complicated. Thankfully, we ended up not choosing that factor.

Jack: Totally. We were lucky we changed our minds. Gender seemed simpler, but honestly, I think we made the right choice focusing on scent memories instead. More interesting!

Mia: Definitely more fun. Though, actually planning it wasn't all fun. What was the biggest headache for us? Was it picking the location?

Jack: The park? Nah, that was okay once we got permission. The real battle was... remember?
(22) We argued for days about how many people we actually needed to test. I thought 30 was plenty, you were pushing for 50!

Mia: Ha! Yeah, that was painful. Glad that's over.

Jack: Me too. And then **we didn't even think about when to run the experiments at first.**

Mia: Oh, don't remind me! We just assumed people could pop by anytime during the week for our smell tests in the campus quad.

Jack: Yeah, big mistake. Hardly anyone came on Tuesday afternoon! (23) We completely forgot to think about when people are actually free. Actually, weekends are golden for this stuff. Everyone was free then.

Mia: Absolutely. Anyway, how did we even get onto this research project? It feels ages ago.

Jack: Oh! The professor recommended us a website, featuring numerous videos created by talented content producers, remember? That documentary about how smells trigger powerful memories? We watched it after that boring lecture and just went, "That's it! That's our project!"

Mia: (24) That's right! That clip totally sparked it. Way more inspiring than just reading journals. So, looking back now, what did you think about the actual results we got?

Jack: Well, the data analysis was straightforward enough. But the stuff people *told* us? Wow. When we asked them what memories the smells brought back, the answers were all over the place! Really different. One smell of cut grass made someone think of football, another of their grandma's garden...

Mia: I know! (25) Their answers varied greatly. From birthday cakes to hospital visits. Really fascinating. And the people taking part were mostly great, weren't they?

Jack: Yeah, really positive bunch. No one moaned about the smells being too strong or asked for money, which was a relief. (26) But some people expressed willingness to join other similar surveys. I'd consider that a really valuable outcome for us. Said they enjoyed it.

Mia: That was lovely. Makes you feel like it was worthwhile.

Before you hear the rest of the talk, you have some time to look at questions 27 to 30.

Now listen and answer questions 27 to 30.

Mia: Right, now we need to plan the presentation for the class next week. What are we doing? Just showing graphs?

Jack: Ok, let's make it more interactive. Do we need to get some perfume samples ready for them?

Mia: I was thinking, I'm a bit hesitant about this, you know it's actually quite difficult to pull off in practice.

Jack: Yeah, I agree. (27) So why not let people smell the actual scents from the primary study? Like the coffee, the lemon, the lavender?

Mia: Oh, I like that! Let them engage with it.

Jack: Yes, and do you think we should ask our advisor for help? Maybe they can share some research data with us?

Mia: Well...In fact, we can collect the data by ourselves, for example, while they're smelling them, (28)we could ask them if it brings any private memories to mind? You know, "What does this smell remind *you* of?" Something like that.

Jack: Perfect! Much better than just talking at them.

Mia: Agreed. So, presentation sorted. Last thing, what would you say was the most difficult aspect of our research project? For me, it wasn't finding volunteers in the end or moving the sniffing stations around.

Jack: Money wasn't even an issue, was it? Cheap as chips. (29)No, the killer for me was figuring out how to confirm whether people recall scents accurately. Like, how do you *test* that memory? We spent ages on that.

Mia: yes, that was a massive challenge! Totally. And linked to that, planning the stages of the activity properly was surprisingly hard. Getting the flow right.

Jack: (30)Yep, making that plan for the different phases was trickier than I expected. But hey, we got there! Ready to present?

Mia: Ready as I'll ever be! Let's do it.

That is the end of Part3. You now have half a minute to check your answers to Part3.

2025 年 5 月 10 日大陆雅思纸笔考试听力文本

Part3.

You will hear Katrina, and her tutor engage in a detailed discussion about her case study project. First, you have some time to look at questions 21 to 24.

Now listen carefully and answer questions 21 to 24.

Katrina: Good afternoon Professor, I've come to present my case study. To be honest, I've been struggling with several aspects recently.

Tutor: Let's start with your study, Katrina. Have you finalized which student you'll be observing?

Katrina: I'm leaning toward Tom. He's one of the top performers in class—his grades are exceptional, and he's always handing in work early. But I'm not sure if intelligence alone is the best criteria.

Tutor: Well, intelligence doesn't always reflect effective learning strategies. What else have you considered?

Katrina: Well, he's diligent. For instance, he stays late to revise, even when others leave. But I'm concerned that focusing purely on effort might overlook other factors.

Tutor: All of these factors are worth considering, but since this is a long-term case study, **(21) we must prioritize whether candidates are truly willing to stay involved.**

Katrina: Yeah, I agree. And when I begin to study the case, there's so much data to collect: classroom observations, interviews, grades, even his study apps. And now, I'm a bit overwhelmed.

Tutor: So, what's your main concern right now? You've got much data already.

Katrina: **(22) Yes, I'm currently unsure which information is actually useful for my research, I mean which data points are most related to my study's focus.** For example, during observations, should I focus on how he interacts with peers or his problem-solving techniques?

Tutor: You can't track everything. Start by narrowing your research questions. If your goal is to study *self-regulated learning*, filter out useless data.

Katrina: That makes sense. I've been trying to document *everything*, but selectivity is key.

Tutor: On a brighter note, what aspect of this project energizes you the most?

Katrina: Honestly, the independence is fantastic. designing my own methodology, no rigid templates. **(23) But what really excites me is testing those new AI-powered voice journals.** Tom records his study reflections verbally, and the app analyzes his metacognition patterns. It's

groundbreaking!

Tutor: I'm glad you're exploring tech integration! Just ensure the tools align with your ethical guidelines.

Katrina: Absolutely. One last thing — If I hit a roadblock, how flexible are your office hours? I worry about deadlines.

Tutor: (24) This term's workload is lighter, no need to book slots in advance. If you get stuck, just shoot me a message or come by - I'm usually around after 2 pm.

Katrina: Oh, that's a relief! I thought I had to wait until the designated consultation week or give five days' notice.

Tutor: Not this time. Given the project's complexity, spontaneous discussions might be more productive. Just avoid Fridays—I'm in meetings all day.

Before you hear the rest of the talk, you have some time to look at questions 25 to 30.

Now listen and answer questions 25 to 30.

Tutor: Let's review your methodology. For observations of classroom performance, you mentioned focusing on math classes.

Katrina: Yes, since math is his strongest subject. I want to see how he tackles complex equations.

Tutor: Well, (25) but behavior can vary across subjects. Observe him in art or science too. He might use different strategies when creativity or experimentation is required.

Katrina: Oh, I hadn't considered that! For the interview with the student, I've prepared a list of 20 questions about his study habits. Should I follow it strictly?

Tutor: Structure is good, (26) But being too strict can limit learning. Adjust your questions as you go. It's more like a talk than a test.

Katrina: OK! And during the think-aloud sessions, Tom explains his reasoning while solving problems, but his thoughts jump around. How can I get clearer data?

Tutor: (27) Try asking targeted follow-ups. Make sure your questions are specific - this will prompt more thoughtful responses and yield more precise data.

Katrina: I've compiled all his grades—math, literature, PE, even music. Should I analyze every course?

Tutor: (28) Only if time permits. Non-academic subjects like PE might offer little insight into cognitive strategies. Prioritize core subjects linked to your research questions.

Katrina: Got it. And I'm nervous about interviewing his teachers. What if my questions are too vague?

Tutor: (29) Practice with a peer first. For example, try practicing as if you're the teacher - it'll help you refine how you phrase things.

Katrina: Brilliant! One last question, the personality profile results are overwhelming. He scored high on 10 traits! How do I synthesize this?

Tutor: (30) Simplify your questions - just focus on the key points.

Katrina: Thank you. It's all clear now. I'm finally feeling confident about this semester's research.

Tutor: Got it! Feel free to contact me if you need help. Goodbye.

Katrina: Goodbye professor.

That's the end of Part3. You now have half a minute to check your answers.
